

ABSTRACT

The present invention relates to a filing appliance,
a system for information management, a method in a
5 computer system, a computer program and a memory medium.
The filing appliance comprises means for holding a
plurality of sheets , with at least one input field,
which is provided with a position-coding pattern and is
adapted to be filled in by means of a drawing device,
10 which while using the position-coding pattern records
positions in the input field in order to record
information entered in the input field, and an initiation
icon provided with a position-coding pattern, a marking
of the initiation icon by means of the drawing device
15 being adapted to initiate an operation in a computer
system communicating with the drawing device, in which
operation an information object is created, which is
identifiable at least by means of information entered in
the input field.
